International experiences

Undergraduate research
International experiences in health care

• Spend a month in Tanzania working with students from ATC
  • Diagnosing and repairing medical equipment
  • Identifying unmet clinical needs

• Host students from Tanzania at Cornell for a month
  • Take unmet needs to project ideas
  • Explore research and medical environments

• International senior design experience
  • Take project to a prototype device
  • Collaborate with peers from Tanzania

• Just completed first year of program.

• Students participate between Junior and Senior year.
Cornell-ATC program senior project

- This year’s team developed a device to diagnose cervical insufficiency, a leading cause of premature birth that is difficult to diagnose.
**Undergraduate research**

- More than half of BME undergraduates participate in research with faculty.

- All BME labs, and most research groups at Cornell, have significant numbers of undergraduate researchers, often coming from many different disciplines.

- Research provides opportunities to interact with faculty, graduate students, and other scientists to discover new knowledge and invent new technologies.

- In BME, this means developing the tools and knowledge to improve our understanding, diagnosis, and treatment of human disease.

- Undergraduates play a major role in the research enterprise at Cornell.
Stalled capillaries cause brain blood flow reductions and memory impairment in Alzheimer’s disease mice.
Undergraduates played a HUGE role in this work.

Neutrophil adhesion in brain capillaries reduces cortical blood flow and impairs memory function in Alzheimer’s disease mouse models.

Abstract:
Increased incidence of stalled capillary flow caused by adhesion of leucocytes to the brain microvascular endothelium leads to a ~20% reduction of cerebral blood flow (CBF) and exacerbates short-term memory loss in multiple Alzheimer’s disease (AD) mouse models. Here, we report that Vascular Endothelial Growth Factor (VEGF) signaling at the luminal side of the brain microvasculature plays an integral role in this capillary stalling...
